Let there be a line passing from the star through the centre of the moon, and let a plane perpendicular to this line pass through the centre of the earth: this plane will be the fundamental plane for the occultation. The system of co-ordinates is similar to that already described for eclipses. The cone circumscribing the moon and star may be regarded as a cylinder having everywhere the same diameter as the moon. This cylinder will intercept the fundamental plane in a circle of which the linear diameter will be the same as that of the moon. The Washington Mean Time is the moment at which the two bodies are in geocentric conjunction in right ascension. At this moment the co-ordinate  $x$  of the axis of the cylinder ou the fundamental plane has the value zero. The column Hour-Angle  $H$  gives the common geocentric hour-angle of the moon and star at the same moment, counted from the meridian of Washington--positive toward the west and negative toward the east. Column  $Y$  gives the co-ordinate  $y$  of the axis of the cylinder upon the fundamental plane at the same moment. Columns  $x_1$  and  $y$  give the hourly variation of  $x$  and  $y$ . The linear unit in these columns is the earth s equatorial radius. The limiting parallels, north and south, show the extreme limits of latitude within which the occultation will be visible. By the aid of these elements, the Washington mean time of immersion and emersion...
